---

Read in the lecture notes:

---

Read the new version of Chapter 4 of the lecture notes.

**Exercise 6.1** Prove the following goals once using inversion and a second time without using inversion. Do not use induction.

- a) Goal  $\sim\text{even } 1$ .
- b) Goal  $\text{forall } n, \text{even } (S (S n)) \rightarrow \text{even } n$ .

**Exercise 6.2** Consider the inductive definition of  $le$  with one proper argument.

**Inductive**  $le (x:\text{nat}) : \text{nat} \rightarrow \text{Prop} :=$   
|  $lex : le\ x\ x$   
|  $leS : \text{forall } y, le\ x\ y \rightarrow le\ x\ (S\ y)$ .

Prove the following by induction on  $le$ .

- a) **Lemma**  $le\_Sright\ x\ y : le\ x\ y \rightarrow le\ (S\ x)\ (S\ y)$ .
- b) Goal  $\text{forall } x, le\ x\ 0 \rightarrow x = 0$ .

**Exercise 6.3** Consider the inductive definition of  $le'$  with two proper arguments.

**Inductive**  $le' : \text{nat} \rightarrow \text{nat} \rightarrow \text{Prop} :=$   
|  $lex' : \text{forall } x, le'\ x\ x$   
|  $leS' : \text{forall } x\ y, le'\ x\ y \rightarrow le'\ x\ (S\ y)$ .

Prove the following two versions of  $Sx \neq 0$  formulated using  $le$  and  $le'$ .

Goal  $\text{forall } x, \sim le\ (S\ x)\ 0$ .

Goal  $\text{forall } x, \sim le'\ (S\ x)\ 0$ .

**Exercise 6.4** Consider the following inductively defined proposition.

**Inductive**  $F : \text{Prop} :=$   
|  $FI : F \rightarrow F$ .

Prove the following goal.

Goal  $F \rightarrow \text{False}$ .

Make sure you understand the goal you need to prove at each stage of the proof.

**Exercise 6.5** Read the development of the abstract Imp language in the Coq file. Make sure you understand the definitions, theorems, and their proofs. Complete the proofs of *Seq\_assoc*, *skip\_div*, *monotone\_while*, *optimization1*, *eval\_monotone* and *eval\_agrees\_divergence*. **Note:** Two new tactics you may find helpful are *exfalso* and *case\_eq*. *exfalso* strengthens the goal by changing the claim to *False*. This can be used when the current hypotheses are inconsistent. *case\_eq t* can be used to replace the combination of tactics *remember t as x. destruct x*.
